# What does type theory look like?

- In mathematics, statements look like the following:
  - Consider a natural number  $n$ . The sum  $n + n$  is even.
  - Consider a space  $X$ . The cone on  $X$  is contractible.
- In type theory, we write this as
  - $n : \mathbb{N} \vdash e(n) : \text{isEven}(n + n)$
  - $X : \text{Spaces} \vdash c(X) : \text{isContr}(CX)$
- Type theory provides:
  - natural numbers type  $\mathbb{N}$
  - product type  $A \times B$
  - sum type  $A + B$
  - function type  $A \rightarrow B$
  - a universe type  $\text{Type}$
  - a type (!) of equalities  $a =_A b$
  - etc

# Different notions of equality

## Synthetic vs. analytic equalities

In type theory with the equality type, we always have a (“synthetic”) equality type between  $a, b : D$

$$a =_D b.$$

Depending on the type  $D$ , we might also have a type of “analytic” equalities

$$a \simeq_D b.$$

A *univalence principle* for this  $D$  and this  $\simeq_D$  states that

$$(a =_D b) \rightarrow (a \simeq_D b)$$

is an equivalence.

# Identicals and indiscernibilites

## Identity of indiscernibles

Leibniz: two things are equal when they are *indiscernible* (have the same properties).

$$(a = b) \leftarrow (\forall P. P(a) \leftrightarrow P(b))$$

# Identicals and indiscernibilities

## Identity of indiscernibles

Leibniz: two things are equal when they are *indiscernible* (have the same properties).

$$(a = b) \leftrightarrow (\forall P. P(a) \leftrightarrow P(b))$$

# Identicals and indiscernibles

## Identity of indiscernibles

Leibniz: two things are equal when they are *indiscernible* (have the same properties).

$$(a =_D b) \leftrightarrow \left( \prod_{P:D \rightarrow \text{Type}} P(a) \simeq P(b) \right)$$

# Identicals and indiscernibilites

## Identity of indiscernibles

Leibniz: two things are equal when they are *indiscernible* (have the same properties).

$$(a =_D b) \leftrightarrow \left( \prod_{P:D \rightarrow \mathbf{Type}} P(a) \simeq P(b) \right)$$

- This holds in type theory.

# Identicals and indiscernibles

## Identity of indiscernibles

Leibniz: two things are equal when they are *indiscernible* (have the same properties).

$$(a =_D b) \leftrightarrow \left( \prod_{P:D \rightarrow \mathbf{Type}} P(a) \simeq P(b) \right)$$

- This holds in type theory.
- Given a univalence principle  $(a =_D b) \simeq (a \simeq_D b)$ , we find an *equivalence principle*:

$$(a \simeq_D b) \rightarrow \left( \prod_{P:D \rightarrow \mathbf{Type}} P(a) \simeq P(b) \right).$$

# Univalence

- We've seen that equality in type theory can be interpreted as notions weaker than classical equality (e.g. isomorphism, paths).
- Voevodsky imported weakness for equality from the interpretation in spaces into type theory by imposing the *Univalence Axiom* (UA):

The canonical function  $(A =_{\text{Type}} B) \rightarrow (A \simeq B)$  is an equivalence of types, for any types  $A$  and  $B$ .

- UA is validated by the interpretation into spaces, but not into propositions, sets, or groupoids.
- Instead we **internalize** these notions.

# Internalization of classical mathematics into type theory

**Classical mathematics:**      **Mathematics à la Martin-Löf:**

# Internalization of classical mathematics into type theory

**Classical mathematics:**      **Mathematics à la Martin-Löf:**

## Univalent mathematics

- If two types  $A, B$  are propositions,

$$(A \simeq B) \simeq (A \leftrightarrow B)$$

## Univalent mathematics

- If two types  $A, B$  are propositions,

$$(A =_{\text{Prop}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \leftrightarrow B)$$

so everything respects bi-implication of propositions.

## Univalent mathematics

- If two types  $A, B$  are propositions,

$$(A =_{\text{Prop}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \leftrightarrow B)$$

so everything respects bi-implication of propositions.

- If  $A, B$  are sets,

$$(A =_{\text{Set}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \cong B)$$

so everything respects bijection of sets.

## Univalent mathematics

- If two types  $A, B$  are propositions,

$$(A =_{\text{Prop}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \leftrightarrow B)$$

so everything respects bi-implication of propositions.

- If  $A, B$  are sets,

$$(A =_{\text{Set}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \cong B)$$

so everything respects bijection of sets.

- For types  $A, B$  which are structured sets (groups, rings, etc),

$$(A =_{\text{Grp}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \cong B)$$

so everything respects isomorphism of groups (or rings, etc).<sup>3</sup>

---

<sup>3</sup>Coquand-Danielsson 2013

## Univalent mathematics

- If two types  $A, B$  are propositions,

$$(A =_{\text{Prop}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \leftrightarrow B)$$

so everything respects bi-implication of propositions.

- If  $A, B$  are sets,

$$(A =_{\text{Set}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \cong B)$$

so everything respects bijection of sets.

- For types  $A, B$  which are structured sets (groups, rings, etc),

$$(A =_{\text{Grp}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \cong B)$$

so everything respects isomorphism of groups (or rings, etc).<sup>3</sup>

- For *univalent* categories  $A, B$ ,

$$(A =_{\text{UCat}} B) \stackrel{UA}{\simeq} (A \simeq B) \simeq (A \simeq B)$$

so everything respects equivalence of univalent categories.<sup>4</sup>

---

<sup>3</sup>Coquand-Danielsson 2013

<sup>4</sup>Ahrens-Kapulkin-Shulman 2015

# Univalent mathematics

- Voevodsky dreamt of ‘univalent mathematics’ in which

$$(A =_D B) \simeq (A \simeq_D B)$$

where  $D$  is any type of mathematical object (propositions, sets, groups, categories,  $\infty$ -categories, etc) and  $\simeq_D$  is the appropriate notion of ‘sameness’ for that type of objects.

- This would give us an appropriate language in which to study  $D$ .

  - $x, y : CO, f, g : CA(x, y) \vdash CE_{x,y}(f, g) : \mathbf{Type}$
- Then we add axioms.

## Level-wise equivalence

### Proposition

For two  $\mathcal{L}$ -structures  $S, T$ ,

$$(S =_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}} T)$$

where  $\cong_{\mathcal{L}\text{-Str}}$  denotes levelwise equivalence.

# Level-wise equivalence

## Proposition

For two  $\mathcal{L}$ -structures  $S, T$ ,

$$(S =_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}} T)$$

where  $\cong_{\mathcal{L}\text{-Str}}$  denotes levelwise equivalence.

A levelwise equivalence  $\mathcal{C} \cong_{\mathcal{L}\text{Cat-Str}} \mathcal{D}$  consists of:

- $e_O : \mathcal{C}O \xrightarrow{\sim} \mathcal{D}O$
- $x, y : \mathcal{C}O \vdash e_A : \mathcal{C}A(x, y) \xrightarrow{\sim} \mathcal{D}(e_Ox, e_Oy)$
- $x : \mathcal{C}O, f : \mathcal{C}A(x, x) \vdash e_I : \mathcal{C}I_x(f) \xrightarrow{\sim} \mathcal{D}I_{e_Ox}(e_Af)$
- $x, y, z : \mathcal{C}O, f : \mathcal{C}A(x, y), g : \mathcal{C}A(y, z), h : \mathcal{C}A(x, z) \vdash \mathcal{C}T_{x,y,z}(f, g, h) \xrightarrow{\sim} \mathcal{D}T_{e_Ox, e_Oy, e_Oz}(e_Af, e_Ag, e_Ah)$
- $x, y : \mathcal{C}O, f, g : \mathcal{C}A(x, y) \vdash \mathcal{C}E_{x,y}(f, g) \xrightarrow{\sim} \mathcal{C}E_{e_Ox, e_Oy}(e_Af, e_Ag)$

# Level-wise equivalence

## Proposition

For two  $\mathcal{L}$ -structures  $S, T$ ,

$$(S =_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}} T)$$

where  $\cong_{\mathcal{L}\text{-Str}}$  denotes levelwise equivalence.

A levelwise equivalence  $\mathcal{C} \cong_{\mathcal{L}\text{Cat-Str}} \mathcal{D}$  consists of:

- $e_O : \mathcal{C}O \xrightarrow{\sim} \mathcal{D}O$
- $x, y : \mathcal{C}O \vdash e_A : \mathcal{C}A(x, y) \xrightarrow{\sim} \mathcal{D}(e_Ox, e_Oy)$
- $x : \mathcal{C}O, f : \mathcal{C}A(x, x) \vdash e_I : \mathcal{C}I_x(f) \xrightarrow{\sim} \mathcal{D}I_{e_Ox}(e_Af)$
- $x, y, z : \mathcal{C}O, f : \mathcal{C}A(x, y), g : \mathcal{C}A(y, z), h : \mathcal{C}A(x, z) \vdash \mathcal{C}T_{x,y,z}(f, g, h) \xrightarrow{\sim} \mathcal{D}T_{e_Ox, e_Oy, e_Oz}(e_Af, e_Ag, e_Ah)$
- $x, y : \mathcal{C}O, f, g : \mathcal{C}A(x, y) \vdash \mathcal{C}E_{x,y}(f, g) \xrightarrow{\sim} \mathcal{C}E_{e_Ox, e_Oy}(e_Af, e_Ag)$

But this is not an equivalence of categories.

# Level-wise equivalence

## Proposition

For two  $\mathcal{L}$ -structures  $S, T$ ,

$$(S =_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}} T)$$

where  $\cong_{\mathcal{L}\text{-Str}}$  denotes levelwise equivalence.

A levelwise equivalence  $\mathcal{C} \cong_{\mathcal{L}\text{Cat-Str}} \mathcal{D}$  consists of:

- $e_O : \mathcal{C}O \xrightarrow{\sim} \mathcal{D}O$
- $x, y : \mathcal{C}O \vdash e_A : \mathcal{C}A(x, y) \xrightarrow{\sim} \mathcal{D}(e_Ox, e_Oy)$
- $x : \mathcal{C}O, f : \mathcal{C}A(x, x) \vdash e_I : \mathcal{C}I_x(f) \xrightarrow{\sim} \mathcal{D}I_{e_Ox}(e_Af)$
- $x, y, z : \mathcal{C}O, f : \mathcal{C}A(x, y), g : \mathcal{C}A(y, z), h : \mathcal{C}A(x, z) \vdash \mathcal{C}T_{x,y,z}(f, g, h) \xrightarrow{\sim} \mathcal{D}T_{e_Ox, e_Oy, e_Oz}(e_Af, e_Ag, e_Ah)$
- $x, y : \mathcal{C}O, f, g : \mathcal{C}A(x, y) \vdash \mathcal{C}E_{x,y}(f, g) \xrightarrow{\sim} \mathcal{C}E_{e_Ox, e_Oy}(e_Af, e_Ag)$

But this is not an equivalence of categories.

And is it appropriate to call  $\mathcal{C}, \mathcal{D}$  categories?

# Indiscernibility

## Definition

Given an  $\mathcal{L}$ -structure  $M$ , and an object  $S$  of  $\mathcal{L}$ , we say that two elements  $x, y : MS$  are *indiscernible* if substituting  $x$  for  $y$  in any object of  $\mathcal{L}$  that depends on (i.e. object with a morphism to)  $S$  produces equivalent types.

## Definition

An  $\mathcal{L}$ -structure  $M$  is *univalent* if for any object  $S$  of  $\mathcal{L}$ , and any  $x, y : MS$ , the type of indiscernibilities between  $x$  and  $y$  is equivalent to the type of equalities between  $x$  and  $y$ .

# Univalent $\mathcal{L}_{\text{cat}}$ structures

Let  $\mathcal{C}$  be a univalent  $\mathcal{L}_{\text{cat}}$  structure.

# Univalent $\mathcal{L}_{\text{cat}}$ structures

Let  $\mathcal{C}$  be a univalent  $\mathcal{L}_{\text{cat}}$  structure.

- Any two terms  $x : \mathcal{C}O, f : \mathcal{C}A(x, x) \vdash i, j : \mathcal{C}I_x(f)$  are indiscernible.
  - Each  $\mathcal{C}I_x(f)$  is a proposition.
  - Similarly, each  $\mathcal{C}T_{x,y,z}(f, g, h), \mathcal{C}E_{x,y}(f, g)$  is a proposition.

# Univalent $\mathcal{L}_{\text{cat}}$ structures

Let  $\mathcal{C}$  be a univalent  $\mathcal{L}_{\text{cat}}$  structure.

- Any two terms  $x : \mathcal{C}O, f : \mathcal{C}A(x, x) \vdash i, j : \mathcal{C}I_x(f)$  are indiscernible.
  - Each  $\mathcal{C}I_x(f)$  is a proposition.
  - Similarly, each  $\mathcal{C}T_{x,y,z}(f, g, h), \mathcal{C}E_{x,y}(f, g)$  is a proposition.
- In the axioms for a category, we have that  $E$  behaves like equality (is reflexive and a congruence for  $T, I, E$ .)
  - Univalence at  $A$  means that  $f = g$  is equivalent to  $\mathcal{C}E_{x,y}(f, g)$ .
  - $\mathcal{C}A(x, y)$  is a set.

# Univalent $\mathcal{L}_{\text{cat}}$ structures

- The indiscernibilities between  $a, b : \mathcal{CO}$  consist of
  - $\phi_{x\bullet} : \mathcal{CA}(x, a) \cong \mathcal{CA}(x, b)$  for each  $x : \mathcal{CO}$
  - $\phi_{\bullet z} : \mathcal{CA}(a, z) \cong \mathcal{CA}(b, z)$  for each  $z : \mathcal{CO}$
  - $\phi_{\bullet\bullet} : \mathcal{CA}(a, a) \cong \mathcal{CA}(b, b)$
  - The following for all appropriate  $w, x, y, z, f, g, h$ :

$$\mathcal{CT}_{x,y,a}(f, g, h) \leftrightarrow \mathcal{CT}_{x,y,b}(f, \phi_{y\bullet}(g), \phi_{x\bullet}(h))$$

$$\mathcal{CI}_a(f) \leftrightarrow \mathcal{CI}_b(\phi_{\bullet\bullet}(f))$$

$$\mathcal{CT}_{x,a,z}(f, g, h) \leftrightarrow \mathcal{CT}_{x,b,z}(\phi_{x\bullet}(f), \phi_{\bullet z}(g), h)$$

$$\mathcal{CE}_{x,a}(f, g) \leftrightarrow \mathcal{CE}_{x,b}(\phi_{x\bullet}(f), \phi_{x\bullet}(g))$$

$$\mathcal{CT}_{a,z,w}(f, g, h) \leftrightarrow \mathcal{CT}_{b,z,w}(\phi_{\bullet z}(f), g, \phi_{\bullet w}(h))$$

$$\mathcal{CE}_{a,x}(f, g) \leftrightarrow \mathcal{CE}_{b,x}(\phi_{\bullet x}(f), \phi_{\bullet x}(g))$$

$$\mathcal{CT}_{x,a,a}(f, g, h) \leftrightarrow \mathcal{CT}_{x,b,b}(\phi_{x\bullet}(f), \phi_{\bullet\bullet}(g), \phi_{x\bullet}(h))$$

$$\mathcal{CE}_{a,a}(f, g) \leftrightarrow \mathcal{CE}_{b,b}(\phi_{\bullet\bullet}(f), \phi_{\bullet\bullet}(g))$$

$$\mathcal{CT}_{a,x,a}(f, g, h) \leftrightarrow \mathcal{CT}_{b,x,b}(\phi_{\bullet x}(f), \phi_{x\bullet}(g), \phi_{\bullet\bullet}(h))$$

$$\mathcal{CT}_{a,a,x}(f, g, h) \leftrightarrow \mathcal{CT}_{b,b,x}(\phi_{\bullet\bullet}(f), \phi_{\bullet x}(g), \phi_{\bullet x}(h))$$

$$\mathcal{CT}_{x,a,a}(f, g, h) \leftrightarrow \mathcal{CT}_{x,b,b}(\phi_{x\bullet}(f), \phi_{\bullet\bullet}(g), \phi_{x\bullet}(h))$$

$$\mathcal{CE}_{a,a}(f, g) \leftrightarrow \mathcal{CE}_{b,b}(\phi_{\bullet\bullet}(f), \phi_{\bullet\bullet}(g))$$

$$\mathcal{CT}_{a,x,a}(f, g, h) \leftrightarrow \mathcal{CT}_{b,x,b}(\phi_{\bullet x}(f), \phi_{x\bullet}(g), \phi_{\bullet\bullet}(h))$$

$$\mathcal{CT}_{a,a,x}(f, g, h) \leftrightarrow \mathcal{CT}_{b,b,x}(\phi_{\bullet\bullet}(f), \phi_{\bullet x}(g), \phi_{\bullet x}(h))$$

$$\mathcal{CT}_{a,a,a}(f, g, h) \leftrightarrow \mathcal{CT}_{b,b,b}(\phi_{\bullet\bullet}(f), \phi_{\bullet\bullet}(g), \phi_{\bullet\bullet}(h))$$

- But this an isomorphism in the usual categorical sense.

→ Univalence at  $O$  means that  $x = y$  is equivalent to  $x \cong y$ .

# The right notion of equivalence

## Main theorem

For two *univalent*  $\mathcal{L}$ -structures  $S, T$ ,

$$(S =_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}}^* T) \simeq (S \twoheadrightarrow T)$$

where  $\cong_{\mathcal{L}\text{-Str}}^*$  denotes levelwise equivalence up to indiscernibility and  $\twoheadrightarrow$  denotes a very split surjective morphism.

# The right notion of equivalence

## Main theorem

For two *univalent*  $\mathcal{L}$ -structures  $S, T$ ,

$$(S =_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}} T) \simeq (S \cong_{\mathcal{L}\text{-Str}}^* T) \simeq (S \twoheadrightarrow T)$$

where  $\cong_{\mathcal{L}\text{-Str}}^*$  denotes levelwise equivalence up to indiscernibility and  $\twoheadrightarrow$  denotes a very split surjective morphism.

## Very surjective morphisms of $\mathcal{L}_{\text{cat}}$ -structures

A *very surjective morphism* or *equivalence*  $F : \mathcal{C} \simeq \mathcal{D}$  of  $\mathcal{L}_{\text{cat}}$ -structures consists of surjections

- $FO : \mathcal{CO} \twoheadrightarrow \mathcal{DO}$
- $FA : \mathcal{CA}(x, y) \twoheadrightarrow \mathcal{DA}(Fx, Fy)$  for every  $x, y : \mathcal{CO}$
- $FT : \mathcal{CT}(f, g, h) \twoheadrightarrow \mathcal{DT}(Ff, Fg, Fh)$  for all  $f : \mathcal{CA}(x, y), g : \mathcal{CA}(y, z), h : \mathcal{CA}(x, z)$
- $FE : \mathcal{CE}(f, g) \twoheadrightarrow \mathcal{DE}(Ff, Fg)$  for all  $f, g : \mathcal{CA}(x, y)$
- $FI : \mathcal{CI}(f) \twoheadrightarrow \mathcal{DI}(Ff)$  for all  $f : \mathcal{CA}(x, x)$

# Summary

For every signature  $\mathcal{L}$ , we have

- a notion of structure,
- a notion of indiscernibility within each sort,
- a notion of univalent structures,
- a notion of equivalence,
- a univalence theorem.

# Summary

For every signature  $\mathcal{L}$ , we have

- a notion of structure,
- a notion of indiscernibility within each sort,
- a notion of univalent structures,
- a notion of equivalence,
- a univalence theorem.

The paper includes examples of

- $\dagger$ -categories,
- profunctors,
- bicategories,
- opetopic bicategories,
- ...

## Current and future work

- Drop the splitness condition for certain structures.
- Extend to infinite structures.
- Formulate an analogue to the Rezk completion.
- Translate the theory into one about structures which can include explicit functions.
- Explore mathematics within examples.
- Give a model-category-theoretic account.

Thank you!
