Goal

To develop a directed type theory.

Goal

To develop a directed type theory.

Goal

To develop a directed type theory.

To formalize theorems about:

Higher category theory

Goal

To develop a directed type theory.

- Higher category theory
- Directed homotopy theory

Goal

To develop a directed type theory.

- Higher category theory
- Directed homotopy theory
 - Concurrent processes

Goal

To develop a directed type theory.

- Higher category theory
- Directed homotopy theory
 - Concurrent processes
 - Rewriting

Goal

To develop a directed type theory.

To formalize theorems about:

- Higher category theory
- Directed homotopy theory
 - Concurrent processes
 - Rewriting

Criteria

 Directed paths are introduced as terms of a type former, hom, to be added to Martin-Löf type theory

Goal

To develop a directed type theory.

To formalize theorems about:

- Higher category theory
- Directed homotopy theory
 - Concurrent processes
 - Rewriting

Criteria

- Directed paths are introduced as terms of a type former, hom, to be added to Martin-Löf type theory
- Transport along terms of hom

Goal

To develop a directed type theory.

To formalize theorems about:

- Higher category theory
- Directed homotopy theory
 - Concurrent processes
 - Rewriting

Criteria

- Directed paths are introduced as terms of a type former, hom, to be added to Martin-Löf type theory
- Transport along terms of hom
- Independence of hom and Id

Syntactically

Martin-Löf's identity type is symmetric/undirected since for any type T, and terms a,b:T, there is a function

$$i: \operatorname{Id}_{\mathcal{T}}(a,b) \to \operatorname{Id}_{\mathcal{T}}(b,a)$$

so that any path $p: Id_T(a, b)$ can be inverted to obtain a path $ip: Id_T(b, a)$.

Syntactically

Martin-Löf's identity type is symmetric/undirected since for any type T, and terms a, b : T, there is a function

$$i: \operatorname{Id}_{\mathcal{T}}(a,b) \to \operatorname{Id}_{\mathcal{T}}(b,a)$$

so that any path $p: Id_T(a, b)$ can be inverted to obtain a path $ip: Id_T(b, a)$.

Can think of these terms as undirected paths

Syntactically

Martin-Löf's identity type is symmetric/undirected since for any type T, and terms a, b : T, there is a function

$$i: \operatorname{Id}_{\mathcal{T}}(a,b) \to \operatorname{Id}_{\mathcal{T}}(b,a)$$

so that any path $p : Id_T(a, b)$ can be inverted to obtain a path $ip : Id_T(b, a)$.

- Can think of these terms as undirected paths
- Can we design a type former of *directed* paths that resembles Id but without its inversion operation i?

Theorem

 ${\cal C}$ cartesian closed category. A functorial reflexive relation

$$1_{\mathcal{C}} \xrightarrow{r} Id \xrightarrow{\epsilon_0 \times \epsilon_1} 1_{\mathcal{C}} \times 1_{\mathcal{C}}$$

models identity types if and only if the mapping path space factorization

$$X \xrightarrow{f} Y \rightsquigarrow X \xrightarrow{1 \times rf} X \times_Y Id(Y) \xrightarrow{\epsilon_1} Y$$

generates a weak factorization system on C where all red (resp. blue) maps are in the left (resp. right) class.

Theorem

 $\mathcal C$ cartesian closed category. A functorial reflexive relation

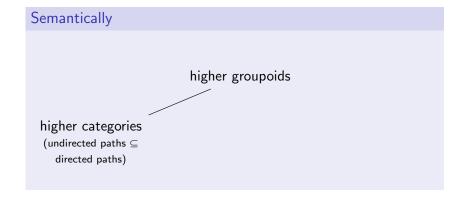

$$1_{\mathcal{C}} \xrightarrow{r} Id \xrightarrow{\epsilon_0 \times \epsilon_1} 1_{\mathcal{C}} \times 1_{\mathcal{C}}$$

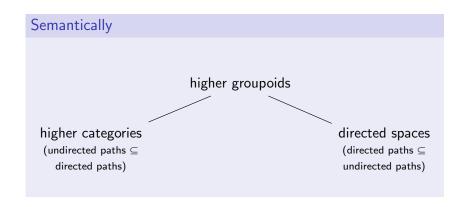

models identity types if and only if it is

- 1. transitive,
- 2. homotopical,
- 3. symmetric.

Semantically

higher groupoids

Conclusion

Directed spaces

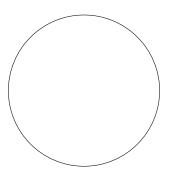

Rough definition

A space together with a subset of its paths that are marked as 'directed'

Directed spaces

Rough definition

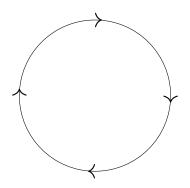

A space together with a subset of its paths that are marked as 'directed'

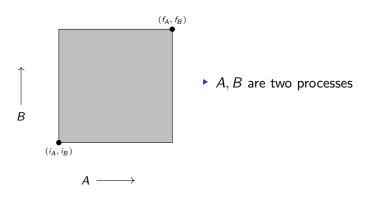

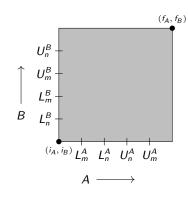

Directed spaces

Rough definition

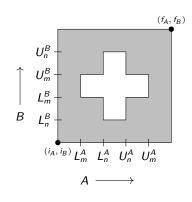

A space together with a subset of its paths that are marked as 'directed'

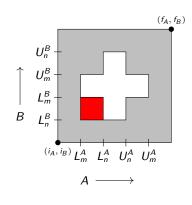

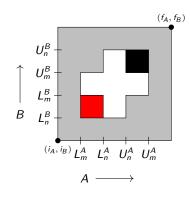

- A, B are two processes
- ▶ *m*, *n* are two memory locations
- which can be locked (L) or unlocked (U) by each process

- ► *A*, *B* are two processes
- ightharpoonup m, n are two memory locations
- which can be locked (L) or unlocked (U) by each process

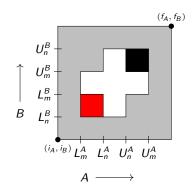

- A, B are two processes
- ightharpoonup m, n are two memory locations
- which can be locked (L) or unlocked (U) by each process

- ▶ A, B are two processes
- ▶ *m*, *n* are two memory locations
- ▶ which can be locked (L) or unlocked (U) by each process

Concurrent processes can be represented by directed spaces.

- ▶ *A*, *B* are two processes
- ▶ *m*, *n* are two memory locations
- which can be locked (L) or unlocked (U) by each process

Fundamental questions:

- ▶ Which states are safe? (Predicate S(x) on X^{op} .)
- Which states are reachable? (Predicate R(x) on X.)

Introduction

Directed homotopy theory

The hom type former

An interpretation in the category of categories

A homotopical perspective

Conclusion

Rules for hom: core and op

$$T$$
 TYPE T^{core} TYPE T^{core} TYPE T^{op} TYPE T^{core} T TYPE T^{core} T TYPE T^{core}

 $\frac{T \text{ TYPE} \qquad t: T^{\mathsf{core}}}{i^{\mathsf{op}}t: T^{\mathsf{op}}}$

Rules for hom: formation

$$\frac{T \text{ TYPE } s: T^{\text{op}} \quad t: T}{\mathsf{hom}_T(s,t) \text{ TYPE}}$$

Rules for hom: formation

$$\frac{T \text{ TYPE } s: T^{\text{op}} \quad t: T}{\mathsf{hom}_T(s,t) \text{ TYPE}}$$

Id formation

$$\frac{T \quad \text{TYPE} \quad s:T \quad t:T}{\text{Id}_T(s,t) \quad \text{TYPE}}$$

Rules for hom: introduction

$$\frac{\textit{T} \quad \text{TYPE} \quad \textit{t} : \textit{T}^{\text{core}}}{1_{\textit{t}} : \text{hom}_{\textit{T}}(\textit{i}^{\text{op}}\textit{t}, \textit{it}) \quad \text{TYPE}}$$

Rules for hom: introduction

$$\frac{\textit{T} \quad \text{TYPE} \quad \textit{t} : \textit{T}^{\text{core}}}{1_{\textit{t}} : \text{hom}_{\textit{T}}(\textit{i}^{\text{op}}\textit{t}, \textit{it}) \quad \text{TYPE}}$$

Id introduction

$$rac{T}{r_t: \operatorname{Id}_T(t,t)} rac{t:T}{\operatorname{TYPE}}$$

Rules for hom: right elimination and computation

$$\begin{array}{ccc} T & \text{TYPE} & s: T^{\text{core}}, t: T, f: \mathsf{hom}_T(i^{\mathsf{op}}s, t) \vdash D(f) & \text{TYPE} \\ & & s: T^{\mathsf{core}} \vdash d(s) : D(1_s) \\ \hline & s: T^{\mathsf{core}}, t: T, f: \mathsf{hom}_T(i^{\mathsf{op}}s, t) \vdash e_R(d, f) : D(f) \\ & s: T^{\mathsf{core}} \vdash e_R(d, 1_s) \equiv d(s) : D(1_s) \end{array}$$

Rules for hom: right elimination and computation

$$\begin{array}{ccc} T & \texttt{TYPE} & s: T^{\mathsf{core}}, t: T, f: \mathsf{hom}_{T}(i^{\mathsf{op}}s, t) \vdash D(f) & \texttt{TYPE} \\ & & s: T^{\mathsf{core}} \vdash d(s) : D(1_{s}) \\ \hline & s: T^{\mathsf{core}}, t: T, f: \mathsf{hom}_{T}(i^{\mathsf{op}}s, t) \vdash e_{R}(d, f) : D(f) \\ & s: T^{\mathsf{core}} \vdash e_{R}(d, 1_{s}) \equiv d(s) : D(1_{s}) \end{array}$$

Id elimination and computation

$$\frac{T \text{ TYPE}}{s:T,t:T,f:\operatorname{Id}_T(s,t) \vdash D(f) \text{ TYPE} \qquad s:T \vdash d(s):D(r_s)} \\ \frac{s:T,t:T,f:\operatorname{Id}_T(s,t) \vdash j(d,f):D(f)}{s:T \vdash j(d,r_s) \equiv d(s):D(r_s)}$$

Rules for hom: left elimination and computation

$$\frac{T \text{ TYPE } s: T^{\text{op}}, t: T^{\text{core}}, f: \mathsf{hom}_{\mathcal{T}}(s, it) \vdash D(f) \text{ TYPE}}{s: T^{\text{core}} \vdash d(s): D(1_s)} \\ \frac{s: T^{\text{op}}, t: T^{\text{core}}, f: \mathsf{hom}_{\mathcal{T}}(s, it) \vdash e_L(d, f): D(f)}{s: T^{\text{core}} \vdash e_L(d, 1_s) \equiv d(s): D(1_s)}$$

Rules for hom: left elimination and computation

$$\frac{T \text{ TYPE } s: T^{\text{op}}, t: T^{\text{core}}, f: \mathsf{hom}_T(s, it) \vdash D(f) \text{ TYPE}}{s: T^{\text{core}} \vdash d(s): D(1_s)} \\ \frac{s: T^{\text{core}} \vdash d(s): D(1_s)}{s: T^{\text{core}}, t: T^{\text{core}}, f: \mathsf{hom}_T(s, it) \vdash e_L(d, f): D(f)} \\ s: T^{\text{core}} \vdash e_L(d, 1_s) \equiv d(s): D(1_s)$$

Id elimination and computation

$$\frac{T \text{ TYPE}}{s:T,t:T,f:\operatorname{Id}_{T}(s,t) \vdash D(f) \text{ TYPE} \qquad s:T \vdash d(s):D(r_{s})}{s:T,t:T,f:\operatorname{Id}_{T}(s,t) \vdash j(d,f):D(f)}\\ s:T \vdash j(d,r_{s}) \equiv d(s):D(r_{s})$$

Syntactic results

▶ Transport: for a dependent type $t : T \vdash S(t)$:

$$t: T^{\mathsf{core}}, t': T, f: \mathsf{hom}_{\mathcal{T}}(i^{\mathsf{op}}t, t'), s: S(it) \\ \vdash \mathsf{transport}_{\mathsf{R}}(s, f): S(t')$$

Syntactic results

▶ Transport: for a dependent type $t : T \vdash S(t)$:

```
\begin{aligned} t : T^{\mathsf{core}}, t' : T, f : \mathsf{hom}_{\mathcal{T}}(i^{\mathsf{op}}t, t'), s : S(it) \\ &\vdash \mathsf{transport}_{\mathsf{R}}(s, f) : S(t') \end{aligned}
```

Composition: for a type T:

$$r: T^{op}, s: T^{core}, t: T, f: hom_T(r, is), g: hom_T(i^{op}s, t)$$

 $\vdash comp_R(f, g): hom_T(r, t)$

Syntactic results

▶ Transport: for a dependent type $t : T \vdash S(t)$:

```
\begin{aligned} t : T^{\mathsf{core}}, t' : T, f : \mathsf{hom}_{\mathcal{T}}(i^{\mathsf{op}}t, t'), s : \mathcal{S}(it) \\ &\vdash \mathsf{transport}_{\mathsf{R}}(s, f) : \mathcal{S}(t') \end{aligned}
```

Composition: for a type T:

$$r: T^{\text{op}}, s: T^{\text{core}}, t: T, f: \mathsf{hom}_{T}(r, is), g: \mathsf{hom}_{T}(i^{\text{op}}s, t) \\ \vdash \mathsf{comp}_{\mathsf{R}}(f, g): \mathsf{hom}_{T}(r, t)$$

• With Σ types, we can define

$$Reachable(T) := \Sigma_{x:T} hom_T(i,x)$$

$$Safe(T) := \Sigma_{x:T^{op}} hom_T(x,f)$$

for any type T with terms $i: T^{op}, f: T$.

Outline

Introduction

Directed homotopy theory

The hom type former

An interpretation in the category of categories

A homotopical perspective

Conclusion

The interpretation

- Use the framework of comprehension categories
- ▶ Dependent types are represented by functors $T : \Gamma \rightarrow Cat$.
- Dependent terms are represented by natural transformations

where $*: \Gamma \to \mathit{Cat}$ is the functor which takes everything to the one-object category.

▶ Context extension is represented by the Grothendieck construction which takes each functor $T:\Gamma \to Cat$ to the Grothendieck opfibration

$$\pi_{\Gamma}: \int_{\Gamma} T \to \Gamma.$$

Interpreting core and op in the empty context

$$\frac{T \text{ TYPE}}{T^{\text{core}} \text{ TYPE}} \frac{T \text{ TYPE}}{it: T} \frac{t: T^{\text{core}}}{i^{\text{op}}t: T^{\text{op}}}$$

For any category T,

- $T^{core} := ob(T)$
- $T^{op} := T^{op}$
- $i: T^{core} \to T$ and $i^{op}: T^{core} \to T^{op}$ are the identity on objects.

Interpreting hom formation and introduction

$$\frac{T \text{ TYPE } s: T^{\mathsf{op}} \quad t: T}{\mathsf{hom}_{T}(s,t) \text{ TYPE}} \qquad \frac{T \text{ TYPE } t: T^{\mathsf{core}}}{1_{t}: \mathsf{hom}_{T}(i^{\mathsf{op}}t,it) \text{ TYPE}}$$

For any category T,

Take the functor

hom :
$$T^{op} \times T \rightarrow Set \hookrightarrow Cat$$
.

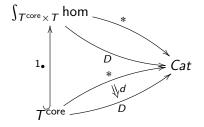

Take the natural transformation

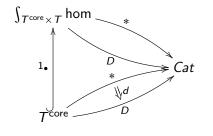

$$T^{\text{core}} \underbrace{\psi_{1\bullet}}_{\text{hom } \circ (i^{\text{op}} \times i)} Cat$$

where each component $1_t : * \rightarrow \mathsf{hom}(t, t)$ picks out the identity morphism of t.

$$\frac{T \text{ TYPE } s: T^{\text{core}}, t: T, f: \text{hom}_{T}(i^{\text{op}}s, t) \vdash D(f) \text{ TYPE}}{s: T^{\text{core}} \vdash d(s): D(1_{s})} \\ \frac{s: T^{\text{core}}, t: T, f: \text{hom}_{T}(i^{\text{op}}s, t) \vdash e_{R}(d, f): D(f)}{s: T^{\text{core}} \vdash e_{R}(d, 1_{s}) \equiv d(s): D(1_{s})}$$

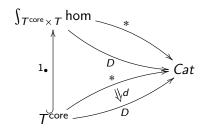

$$\begin{array}{ccc} T & \text{TYPE} & s: T^{\text{core}}, t: T, f: \mathsf{hom}_T(i^{\mathsf{op}}s, t) \vdash D(f) & \text{TYPE} \\ & & s: T^{\mathsf{core}} \vdash d(s) : D(1_s) \\ \hline & s: T^{\mathsf{core}}, t: T, f: \mathsf{hom}_T(i^{\mathsf{op}}s, t) \vdash e_R(d, f) : D(f) \\ & s: T^{\mathsf{core}} \vdash e_R(d, 1_s) \equiv d(s) : D(1_s) \end{array}$$

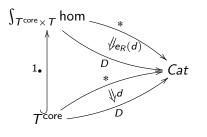

Use the fact that the subcategory T^{core} is 'initial':

$$\begin{array}{ll} T & \text{TYPE} & s: T^{\text{core}}, t: T, f: \mathsf{hom}_T(i^{\mathsf{op}}s, t) \vdash D(f) & \text{TYPE} \\ & s: T^{\mathsf{core}} \vdash d(s) : D(1_s) \\ \hline & s: T^{\mathsf{core}}, t: T, f: \mathsf{hom}_T(i^{\mathsf{op}}s, t) \vdash e_R(d, f) : D(f) \\ & s: T^{\mathsf{core}} \vdash e_R(d, 1_s) \equiv d(s) : D(1_s) \end{array}$$

- Use the fact that the subcategory T^{core} is 'initial':
 - for every $(s,t,f) \in \int_{T^{\mathsf{core}} \times T} \mathsf{hom}$ there is a unique morphism $(1_s,f): (s,s,1_s) \to (s,t,f)$ with domain in T^{core}

- Use the fact that the subcategory T^{core} is 'initial':
 - for every $(s,t,f) \in \int_{T^{\mathsf{core}} \times T} \mathsf{hom}$ there is a unique morphism $(1_s,f): (s,s,1_s) \to (s,t,f)$ with domain in T^{core}
- Set $e_R(d)_{(s,t,f)} := D(1_s,f)d_{(s,s,1_s)}$

$$\frac{T \text{ TYPE } s: T^{\text{op}}, t: T^{\text{core}}, f: \mathsf{hom}_T(s, it) \vdash D(f) \text{ TYPE}}{s: T^{\text{core}} \vdash d(s): D(1_s)} \\ \frac{s: T^{\text{op}}, t: T^{\text{core}}, f: \mathsf{hom}_T(s, it) \vdash e_L(d, f): D(f)}{s: T^{\text{core}} \vdash e_L(d, 1_s) \equiv d(s): D(1_s)}$$

Replace T by T^{op} and apply right hom elimination and computation.

Outline

Introduction

Directed homotopy theory

The hom type former

An interpretation in the category of categories

A homotopical perspective

Conclusion

A homotopical perspective

While the homotopy theory of isomorphisms in categories

$$\mathcal{C} \to \mathcal{C}^{(\cong)} \to \mathcal{C} \times \mathcal{C}$$

provides an interpretation of Martin-Löf's identity type, the homotopy theory of morphisms in categories

$$\mathcal{C} \to \mathcal{C}^{(\to)} \to \mathcal{C} \times \mathcal{C}$$

provides an interpretation of this hom former.

The weak factorization system

- Let (≅) denote the category with two objects and one isomorphism between them.
- Let (→) denote the category with two objects and one morphism between them.
- Then factorize the codiagonal of the one-point category in two ways

$$*+* \rightarrow (\cong) \rightarrow * \qquad *+* \rightarrow (\rightarrow) \rightarrow *$$

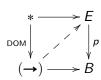

which produces a factorization of any diagonal in two ways which each generate weak factorization systems.

$$\mathcal{C} \to \mathcal{C}^{(\cong)} \to \mathcal{C} \times \mathcal{C} \qquad \qquad \mathcal{C} \to \mathcal{C}^{(\to)} \to \mathcal{C} \times \mathcal{C}$$

- ▶ The first gives an interpretation of the ld type in Cat.
- ► The second underlies this interpretation of the hom type in Cat.

The weak factorization system continued

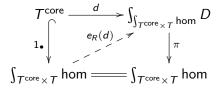

The right class of this weak factorization system are those functors p : E → B which have the enriched right lifting property

- so all Grothendieck opfibrations (dependent projections) are in the right class.
- ▶ The functor $1_{\bullet}: T^{\mathsf{core}} \hookrightarrow \int_{T^{\mathsf{core}} \times T} \mathsf{hom}$ is the left part of the factorization of

$$i: T^{core} \rightarrow T$$

▶ Then the right hom elimination and computation rule arises from the weak factorization system.

Outline

Introduction

Directed homotopy theory

The hom type former

An interpretation in the category of categories

A homotopical perspective

Conclusion

Summary

We have:

a directed type theory

Summary

We have:

- a directed type theory
- with a model in Cat.

Summary

We have:

- a directed type theory
- with a model in Cat.

Future work

We need to:

- ▶ integrate this into traditional Martin-Löf type theory
 - integrate Id and hom in the same theory
 - specify Σ, Π, etc

Summary

We have:

- a directed type theory
- with a model in Cat.

Future work

We need to:

- integrate this into traditional Martin-Löf type theory
 - integrate Id and hom in the same theory
 - specify Σ, Π, etc
- find interpretations in categories of directed spaces
 - build 'directed' weak factorization systems
 - build universes
